Light Scattering Reviews 2 (Springer Praxis Books) Alexander A. Kokhanovsky

Light scattering is used in many applications, ranging from optical particle sizing of powders to interstellar dust studies. At the moment there is no a specialized journal aimed at studies of exclusively light scattering problems. Instead, different aspects of the problem and also different applications are considered in a variety of specialized journals covering several scientific disciplines such as chemistry, physics, biology, medicine, astrophysics, and atmospheric science, to name a few. The Light Scattering Reviews (LSR) series started in 2006 with the aim of facilitating interaction between different groups of scientists working in diverse scientific areas but using the same technique, namely light scattering, for solution of specific scientific tasks. This second volume of LSR is devoted mostly to applications of light scattering in atmospheric research. The book consists of eight contributions prepared by internationally recognized authorities in correspondent research fields. The first paper prepared by Howard Barker deals with the recent developments in solar radiative transfer in the terrestrial atmosphere and global climate modelling. In particular, methods to compute radiative transfer characteristics needed for numerical global climate models are discussed in a great depth. Their deficiencies are addressed as well. The problem of 3D radiative transfer in cloudy atmospheres, a hot topic in modern climate modelling, is also considered.
